Target version:		Spent time:	0:00 hour
Description			
<p>Create a SQL SELECT query for Windchill to retrieve all objects with their maximum (latest) version/iteration across all relevant object types, including their associated links (e.g. OwnerLinks, ContentLinks, DescribeLinks, etc.).</p> <p>The query should identify the latest revision for each object, join the necessary link tables, and return a consolidated result set showing object metadata together with its relationships. It should be optimized for performance and ensure that only the highest available versions are included.</p>
